Abstract:
This paper briefly investigates the impact of the participation of Egypt in the IMF loan program in November 2016 on the Egyptian macroeconomic performance and social protection. It uses the “before-after” approach to measure the changes in the macroeconomic variables. All the variables are measured by using the descriptive analyses. It was found that the effects of the IMF program were positive and the macroeconomic performance along with social protection programs have significantly improved.

Keywords: IMF, Loan, Economic Growth, Egypt.
JEL Classification: G2, E00.

1. Introduction

In November 2016, the Egyptian government – after two years of negotiation – reached an agreement with the IMF for a US$ 12 billion loan funded over three years under the Extended Fund Facility (EFF) alongside a structural reform program. This agreement was intended to rescue the economy after a significant downward trend in all macroeconomic objectives.

This paper briefly attempts to know how the IMF that Egypt has been received over the course of the last three years affected the macroeconomic performance and social protection. It uses the “before – after” method to examine the change in each macroeconomic variable before the implementation of the program and after two years and half from the start date. Descriptive analyses are used to measure the change happened in each variable before and after the mentioned period. Precisely, unemployment, inflation, economic growth, FDI, and budget deficit will be measured throughout this paper by unemployment rate, CPI, real GDP, and changes in FDI and budget deficit, respectively. Moreover, social protection will be measured by the total government expenditure on social safety.

The finding will contribute to the literature by measuring the impact of an IMF loan on the economic performance of one country and help the government take decisions to further improve the economic situation.

The remaining sections of this report are structured as follows: Section 2 takes a brief review on the previous literature. Section 3 analyzes the changes in the variables and briefly discusses the results. Section 4 concludes the paper and gives policy implications.

2. Literature Review

Theoretically, the IMF interference can impact economic growth by “its money, the policy conditions it attaches to its loans and, more generally, its policy advice” (Dreher, 2006, p.2). The overall finding in the literature states that the IMF loan programs do not necessarily foster economic outcomes of the recipient countries (Fidrmuc & Kostagianni, 2015).

The empirical evidences in the literature substantially vary in accordance to the sample, method, and instrument used. Przeworski and Vreeland (2000) found that the participation of countries in IMF loan programs negatively affects economic outcomes. Barro and Lee (2005) have found similar positive effects, using a combination of political and
economic instruments. In contrast, Dicks-Mireaux, Mecagni, and Schadler (2000) conclude, using a sample of 74 countries, that the participation in an IMF loan program has positive effects on economic output.

Nonetheless, all the contributions that examined the results of IMF loan programs were conducted on a dataset containing many countries which significantly affected the findings. This paper focuses only on one country which will apparently clarify the impact of the IMF aid assistance on macroeconomic performance. In addition, no papers took into account the effect of the loan on social protection which will be under study in this paper.

3. Data Analysis

In this section, the changes in macroeconomic variables: economic growth, unemployment, Foreign Direct Investment, budget deficit, and inflation will be depicted and analyzed.

3.1 Macroeconomic Performance

Fig.1: Changes in Macroeconomic Performance in Egypt since the Start of the IMF Program

Source: (IMF, World Economic Outlook Database, April 2019).
As depicted in Figure 1, economic growth has been accelerating since and during the implementation of the program, rising from 4.3 in 2016 to 5.5 in 2019, and it is projected to reach 5.9 in the start of 2020 (IMF, 2019). Foreign Direct Investments (FDI) have risen dramatically till 2018 when it experienced a slight decline, then it has increased substantially to reach $9.5 billion in 2019.

Moreover, the unemployment rate has been steadily decreasing throughout the period of the program. Declining from 12.7% before the start of the program until it has become 9.5% in the year of 2019, which is the lowest percentage since 2011. The budget deficit has been on a downward trend since 2016 as it was a main objective behind the program. It has decreased from 12.7 percent of GDP in 2016 to 8.1 percent in 2019.

**Fig.1 : Changes in Inflation Rate over the Period of the Program**

As a consequence of the reform program that accompanied the IMF loan, the inflation rate has been fluctuating since the start of the program. The reform program – that was carefully planned to mitigate the anticipated negative effects out of the adjustments required the government to reduce the huge energy subsidies which, in turn, raised the prices of energy products. This surge in the prices caused inflation to accelerate substantially
in 2017 to around 33 percent in June. Since then, it started to decrease dramatically to reach 14 percent in 2019.

3.2 Social Protection

Recently, the IMF reported in its final review of the Egyptian loan program that authorities in Egypt have opted for “expanding the number of better-targeted social programs. These programs include: cash transfer programs, programs to help the unemployed find jobs, programs to provide women with microcredits, and programs to provide access to clean drinking water and sanitation” (IMF, 2019). Hence, the overall government expenditure on social protection has significantly accelerated since the start of the program to compensate the negative consequences of the reform program, as depicted below in Figure 3.

4. Conclusion

The analyses have depicted the credibility of Christine Lagarde’s statement that Egypt has attained crucial progress on the macroeconomic and social protection levels. The overall macroeconomic performance in Egypt has been improving since the start of the program. High growth rate has been achieved, Foreign Direct Investments have increased, unemployment has reduced to its lowest rate since the revolution in 2011, budget deficit is on a downward track, and inflation is projected to decline further during this year. Furthermore, the government expenditure on social protection programs has witnessed a crucial surge.

This finding agrees with Barro and Lee (2004) that the effects of IMF programs are positive and might agree with Joyce (2004) and Binder and Bluhm (2014) that the effects vary in response to the commitment toward the program’s conditions.

Number of unavailable and inaccurate data was encountered during the process of conducting this report. No available data on government expenditure on social protection was found on the government’s official sources, so the IMF report was the main source for such data. Inflation data is not generally precise because of the fixed and outdated basket of goods and services that is used in calculating inflation.

This report was prepared to examine the claim of Christine Lagarde’s statement that the IMF program has positively affected the Egyptian macroeconomic performance and expanded the coverage of social protection. After analyzing changes in macroeconomic variables and government spending on social safety, it is apparent that real GDP and FDI showed a significant increase, budget deficit and unemployment are on a downward trend, and inflation is declining. In addition, the total government spending on subsidies, grants, and social benefits has substantially accelerated over the course of the preceding three years.

Nonetheless, the gross debt is still high and the social protection programs do not fully cover all the negatively affected households. Hence, it is proposed for the government to: (1) cut off loans and increase progressive taxes in order to repay the debts, (2) continue implementing the program at “the planned pace given the large remaining gap between retail prices and cost recovery” (IMF, 2018), and (3) further use the revenues that come from taxes to increase the expenditure on social protection (ILO, 2017).
